

VERMOT BRUSH'KIT

Optimum scraping efficiency with Brush'Kit

Optimum scraping efficiency with Brush'Kit

Brush'Kit is a system of custom-made brushes retro fitted to automatic scraper blades. The brush bristle height is adjustable ensuring close contact with concrete surface.

Improved herd health

Thanks to Brush'Kit, cubicle and feed passages are cleaner and drier. Conditions required to fight digital dermatitis, Mortellaro and other hoof related problems.

ADAPTABLE AND HARD WEARING

Brush'Kit is made to measure, brush lengths are customised to fit scraper blades, support lugs are welded in place and the kit is quick and easy to assemble.

The bristles have been specially developed to maximise the scraping efficiency. They have a density four times greater than a standard broom. This ensures a leakproof barrier sweeping slurry before it and leaving a clean and dry surface behind.

Brush height is adjustable by jacking screws in order to maintain best performance and to compensate for variations of concrete finish and level.

Conscious of the environment in which this system is working the construction is robust simple and rot proof. Only the brush heads will require replacing.

VERMOT

Denis Vermot, dairyman until the year 2000, was acutely aware of the problems posed by slippery surfaces in agricultural buildings.

In 1989 he created the VR Company to bring answers and solutions to this problem. Since that time there has been a constant search for new ideas to ensure the safety and comfort of cattle.

These innovations have been rewarded by several industry awards.
